

CHOOSE YOUR EXPERIMENT

Every experiment below can be completed at school with materials your teacher provides. Pick the one you are most curious about. Within each experiment you still make real choices, such as which surface, which plant, or which music, so the project is genuinely yours.

1

Does water temperature affect how fast sugar dissolves?

You measure: time to dissolve in seconds

You choose: which temperatures to test

2

Which paper towel brand absorbs the most water?

You measure: volume absorbed in mL, and cost per unit

You choose: which three brands to compare

3

Does the color of light affect plant growth?

You measure: plant height in cm over two weeks, and leaf count

You choose: which plant and which colors

4

Does music tempo affect resting heart rate?

You measure: heart rate in BPM before and after listening

You choose: which songs and tempos

5

Which surface produces the most friction for a sliding object?

You measure: distance traveled in cm

You choose: which surfaces and which object

6

Does soil type affect how fast water drains?

You measure: drainage time in seconds per soil type

You choose: which three soils to test

7

How does the amount of air in a ball affect bounce height?

You measure: bounce height in cm at different PSI values

You choose: which ball and which pressures

ONCE YOU HAVE CHOSEN

Write your choice in your science journal with the date. Then use the Hypothesis Worksheet to turn your experiment into an if, then, because prediction.
